

HEALTH INNOVATION - An Interdisciplinary Approach, 5 credits

Are you interested in learning about health innovations and how your knowledge, skills and ideas can improve and develop health care?

The course targets master students about to start their master thesis project, PhD students and **professionals (late application, see below)**. All disciplines are welcome! The course will run once a week in late afternoons from February until May 2018 consisting of lectures and workshops. For MSc students, it will not impinge on your master thesis work, but should be regarded as a complement that may help you identify new aspects of your project and how your ideas and results can contribute to public health.

The course will be divided in three parts:

The innovative group: foundations of innovations, group dynamics, leadership and design thinking to create ideas.

The innovative society: history of health innovations, evaluation of innovations, implementation of innovations and the legal challenges of innovations.

The innovative organization: funding of innovations, protection of innovations, examples of successful innovations and pitching your idea.

*If you want to go fast - go alone
If you want to go far - go together!*

Applications:

Late application opens 15 Dec. BSc degree (kand/yrkesexamen 180 hp) required. Admission depends on available slots
